

Project Nimbus: Internal Knowledge Base

Document Type: Test Fixture for RAG Evaluation
Version: 1.0

1. Overview

Project Nimbus is a fictional internal platform used only to test retrieval-augmented generation systems. It has no relation to any real product. This document contains distinct facts, numbers, and sections so you can verify that a RAG pipeline correctly chunks, embeds, retrieves, and cites the right passages.

2. Key Facts

The Nimbus platform was launched internally on March 14, 2021. It is maintained by the fictional Cloud Systems Guild, led by team lead Priya Anand. The system processes an average of 42,000 requests per day across three regions: North Zone, Delta Zone, and Harbor Zone. The current uptime target (SLA) is 99.95%.

3. Component Table

Component	Owner	Status	Version
Ingestion Service	Team Aurora	Active	3.2.1
Vector Index	Team Borealis	Active	1.9.0
Query Router	Team Cascade	Deprecated	2.0.4
Cache Layer	Team Aurora	Active	4.1.0

4. Incident History

On July 9, 2022, the Query Router experienced a 47-minute outage caused by a misconfigured load balancer rule. Root cause analysis identified a missing timeout value in the Delta Zone configuration file. A fix was deployed on July 10, 2022, and no repeat incidents have been recorded since.

5. Frequently Asked Questions

Q: Who approves new component deployments?

A: Deployments are approved by the Cloud Systems Guild review board, chaired by Priya Anand.

Q: What is the retry policy for failed ingestion jobs?

A: Failed ingestion jobs are retried up to 5 times with exponential backoff starting at 2 seconds.

Q: Which zone handles the most traffic?

A: The North Zone handles the largest share, roughly 55% of total daily requests.

6. Appendix: Glossary

Term	Definition
Vector Index	A data structure storing embeddings for similarity search.
Cache Layer	A component that stores frequently accessed query results.
SLA	Service Level Agreement, the promised uptime percentage.

End of document. This page intentionally includes a second page so you can test cross-page chunking and page-number citation accuracy.
